Floats
An introduction to CSS layouts
Because block elements stack vertically, we've been
limited to a single column layout.

Floats let us put block level elements side by side.

Float left

📄 `style.css`

```css
.floated-element {
    width: 50%;
    float: left;
}
```

.floated-element

Float left

📄 style.css

```css
.floated-element {
    width: 50%;
    float: left;
}
.red {
    background-color: pink;
}
.blue {
    background-color: blue;
}
```

.floated-element
.red

.floated-element
.blue

Float right

📄 style.css

```css
.floated-element {
    width: 50%;
    float: right;
}
```

.floated-element

Center align

📄 style.css

```css
.floated-element {
    width: 50%;
    margin: 0 auto;
}
```

.floated-element

Clearing floats

"Clearing" a float is when we tell a block to ignore any floats that appear before it.

Instead of flowing around the floated box, a cleared element always appears after any floats.

Method 1: clear

Apply `clear: both;` to the element that appears AFTER the floated element

📄 `index.html`

```
<div class="floated-one">
    ...
</div>
<div class="floated-two">
    ...
</div>
<div class="clear-this-one">
    ...
</div>
```

Same container as
floated elements

📄 `style.css`

```
.floated-one, .floated-two {
    float: left;
}

.clear-this-one {
    clear: both;
}
```

Method 2: overflow hidden

By adding an `overflow: hidden;` declaration to a container div, we're telling it to recognize the height of any floated elements it contains.

📄 `index.html`

```
div class="container">
    <div class="floated-one">
        ...
    </div>
    <div class="floated-two">
        ...
    </div>
</div>
<div class="clear-another">
    ...
</div>
```

Outside of container with floated elements

📄 `style.css`

```
.floated-one, .floated-two {
    float: left;
}

.clear-this-one {
    overflow: hidden;
}
```
